

THE Poultry and Egg SITUATION

BUREAU OF AGRICULTURAL ECONOMICS
UNITED STATES DEPARTMENT OF AGRICULTURE

PES - 123

BAE

OCTOBER - NOVEMBER 1947

Approved by the Outlook and Situation Board October 21, 1947

SUMMARY

Cash receipts of poultrymen in 1948 are expected to be at least as high as the 2-3/4 billion dollars estimated for 1947. The prospective increase in prices for poultry products is likely to offset the probable decline in production. Net income, on the other hand, might well be lower because of increasing production costs, particularly costs of feed.

Prices to egg producers in 1948 will average at least as high as in 1947. But production will exceed domestic demand and prices will be at or near support levels during the year.

Minimum support levels during February-June 1948, will be about as high as the actual prices received during the same period of 1947. During the last few months, the parity index--the index of prices paid by farmers including interest and taxes--which determines the support level, has been rising and reached a new record in September.

Farmers are likely to raise fewer chickens in 1948 than in 1947. Feed costs are expected to be higher during the 1948 hatching season than in the same period of 1947. Even though egg prices are somewhat higher, the egg-feed ratio will be substantially lower in 1948 than in 1947. In the past, similar changes in the ratio have usually resulted in a moderate decrease in the number of chickens raised.

Egg production for 1948 as a whole probably will be somewhat below 1947, largely because there will be fewer replacements for farm flocks during the latter part of the year. In addition, culling may be somewhat heavier during the spring and early summer months of 1948 because of smaller feed supplies and high feed costs. Production per layer is expected to be about the same.

High consumer incomes and prospects that red meat supplies will be smaller than in 1947, particularly during the second half of 1948, will tend to keep demand for chicken and turkey somewhat stronger than this year. Chicken meat output is expected to be somewhat less than in 1947, and turkey production is not expected to change greatly. Accordingly, prices of both chicken and turkey are expected to average higher in 1948 than 1947.

The Poultry and Egg Situation at a Glance

2/ Average 1941-45.

OUTLOOK FOR 1948

The important considerations in the outlook for poultry and eggs in 1948 are:

(1) Consumers incomes are expected to continue high. (2) Meat supplies are likely to be 5 to 10 percent less than in 1947, with much of the reduction coming in the latter part of the year. Meat prices probably will remain near the record levels of 1947. (3) The volume of agricultural exports, which is running at the rate of 4 billion dollars in 1947, is likely to continue high. (4) Feed prices will stay higher than the same months of the preceding year at least until 1948 crop prospects are known. (5) Less feed grain will be available.

Demand for Poultry ProductsTo Continue High

Demand for eggs, chickens, and turkeys probably will continue about as strong in 1948 as in 1947. With prospects for continued high consumer income, smaller meat supplies and large food exports, consumption of all poultry products probably will continue at or near 1947 levels, even though prices may be somewhat higher.

In 1947, consumers are using about as many eggs as in 1946, 380 per person, but retail prices are averaging 25 percent higher. Consumption of chicken meat is slightly less than in 1946, and prices have been higher than last year. Turkey consumption in 1947 will probably be somewhat lower than in 1946 and prices about the same.

Egg Prices in 1948 to AverageHigher than in 1947

Egg prices in 1948 are likely to average higher than in 1947. During the first half of the year, they are expected to average somewhat higher than in the same period of 1947. In the second half, prices may be about the same as in the last half of 1947.

Even with high egg consumption in prospect, supplies probably will exceed domestic demand at or near support prices during the late winter and spring of 1948. The excess of supply over demand for March through June, the flush production season is expected to be substantially less than in 1947. This year, the United States Department of Agriculture purchased equivalent of 275 million dozen shell eggs to meet British commitments and for price support.

Minimum support levels for eggs may be somewhat higher than in the same period of 1947. In recent months, the parity index--the index of prices paid by farmers including interest and taxes--has been increasing. From February through June 1947, this index averaged 228 ($1910-14 = 100$), but by mid-September it was up to 257.

Eggs, chickens, and turkeys are among the "Steagall" commodities which are to be supported at not less than 90 percent of parity through December 31, 1948. At present, the Department policy is to support eggs on a national annual basis.

Storage Movement of Shell EggsTo be Greater than in 1947

The storage of shell and frozen eggs, particularly shell eggs, is expected to be much larger in 1948 than in 1947. This year, the storage margin was substantially above the long-time average. This usually results in an increased into-storage movement in the following year and a consequent lowering of the margin.

In 1947, the into-storage movement of shell eggs was the lowest in 27 years of record. On October 1, 1947 shell egg holdings were 2.8 million cases, about one-half those of a year earlier. Frozen egg holdings totaled 216 million pounds, about the same as on October 1, 1946. Of this quantity, 59 million pounds were Government owned, but a year earlier 10 were Government owned.

Fewer Eggs in 1948

Egg production in 1948 is expected to be less than in 1947. Some decline in the average number of layers probably will occur but production per layer will be about the same.

The number of hens and pullets that will be on farms January 1, 1948 is estimated at 440 million, slightly more than the 437 million on January 1, 1947. Egg production during the first half of 1948 is likely to be about the same as in the first half of 1947 since the number of layers may be about the same. But in the second half of 1948, some decline in output is in prospect. The number of pullets to be added to farm flocks in the fall of 1948 probably will be smaller than this year, since the egg-feed ratio during the coming flush production season is expected to be lower.

The average rate of lay per layer on hand in 1947 is setting a new record of about 155 eggs. Smaller feed supplies, at least through the first half of 1948, are likely to result in a lower rate of feeding in 1948. But this will be offset largely by the upward trend in production per layer. During the past 12 years, production per hen has been increasing at an average of 2 percent each year.

Although egg production in the first half of 1948 may be about the same as in the first half of 1947, supplies are likely to decline some because of the sharp reduction in storage stocks of frozen and shell eggs. Cold-storage stocks of shell and frozen eggs on January 1, 1948 are expected to be 30 to 60 million dozen, shell equivalent, below a year ago.

Assuming that the into-storage movement of shell and frozen eggs during 1948 will be about one to three million cases above 1947, and that the carry-over this coming January 1 will be smaller than last, total egg supplies for the first half of 1948 will be somewhat below those in the first half of 1947. Civilian consumption of eggs is likely to be about as high in the first half of 1948 as in the first half of 1947. Hence, the excess of eggs over domestic needs is likely to be substantially below that of 1947.

During the second half of 1948, supplies of eggs for civilian consumption will be as large as or larger than in the second half of 1947. Larger storage stocks will about offset any decrease in output that may occur.

Export Outlook

Demand from foreign countries for eggs and egg products, particularly from Great Britain, is uncertain. However, output of eggs in Great Britain and Continental Europe is substantially below prewar. Although production in 1947 was above the low 1945 levels, the tight grain situation in Western Europe is expected to reduce output again in 1948. This may result in some outlets by foreign countries. In 1947, the British purchased 38 million pounds of dried eggs. Exports to other countries were negligible.

At the end of October, the United States Department of Agriculture held about 28 million pounds of dried eggs and 61 million pounds of frozen eggs. These stocks are being offered for sale--the dried eggs for export only.

Egg-feed Price Ratio to be Lower

The egg-feed price ratio is expected to average lower, at least through June 1948, than in the same period of 1947. Egg prices may be up slightly but feed prices are likely to be substantially higher. In mid-September, the cost of the poultry ration was \$4.67 per hundred pounds, 25 percent higher than in March and 19 percent higher than in April. Feed prices are expected to continue high. As a result, egg-feed price ratios from next February through June probably will be about 10 to 15 percent below 1947.

Table 1.-Egg-feed price ratio, chickens raised, and hens and pullets on farms, December 31, United States, 1925-47

Year	Egg-feed price ratio*		Hens and pullets on farms	Egg-feed price ratio	Percentage of preceding year	
	(weighted average)	Dec. 31	Dec. 31	ratio	Chickens raised	pullets on farms

1947 1/	11.3	742	440	95	100	101

1/ Preliminary.

* Weights are as follows: November, 1; December, 2; January, 3; February, 4; March, 5; April, 3; May, 1.

Total supplies of all feed concentrates for the 1947-48 feeding season are the smallest since 1940 and about 13 percent below last year's large supply. This is largely due to the sharp drop in corn production. Total 1947 feed-grain production is nearly one-fourth less than the record output in 1946. But the carry-over in 1947 was much larger than in 1946, and more wheat probably will be fed so that supplies are more adequate than production would indicate. With fewer livestock on farms than in recent years, the supply of feed concentrates per animal unit will be a little smaller than in most of the war years, but about the same as the 1937-41 average.

Except for 1947, a decrease in the egg-feed price ratio from the previous year always has resulted in a reduction of the number of chickens raised. Accordingly, it is expected that the number of chickens raised for flock replacements in 1948 will be moderately below that for 1947.

Total Chicken Meat Output in 1948 to be Less than 1947;
Prices Likely to Average Higher

Total chicken meat production in 1948 is likely to be about 5 percent below 1947. Because of prospects that fewer chickens will be raised in 1948, practically all of the reduction will be in chicken meat produced from farm flocks, and most of it is likely to occur during the latter part of the year.

Commercial broiler output for the year as a whole may be about as large as in 1947, depending on the outcome of feed crops in 1948. Output during the first half of 1948 is likely to be less than this year, largely because of smaller supplies and less favorable prices of feed. During the latter half of 1948, broiler production will be larger than a year earlier if feed crops are average or better.

Prices to be received by farmers and broiler growers for chicken meat in 1948 probably will average higher than in 1947, particularly in the latter part of the year. At that time, red meat and chicken meat supplies will be smaller for the season than in recent years.

Turkey Output in 1948
Not Much different from 1947

Turkey growers are not likely to raise any more birds in 1948 than in 1947, even though prices during the 1947 marketing season are expected to average somewhat higher than in 1946. Although an increase in prices usually encourages a larger output the following year, less favorable feed price relationships in prospect for the next few months may have an opposite effect on farmers' plans for 1948.

Turkey supplies for the 1947 holiday season will be only about 10 percent less than last year, even though 16 percent fewer turkeys were raised in 1947 than in 1946. A smaller into-storage movement than in 1946 will offset part of the decline in supplies.

Cash Receipts from Poultry ProductsTo be About as High as 1947;Net Income Lower

Poultry men are expected to receive about as much money from eggs, chickens, broilers, and turkeys in 1948 as in 1947. The decline in total output of poultry products will be about offset by higher prices. In mid-October it was estimated that cash receipts from poultry products will be about 2-3/4 billion dollars in 1947.

Producers will receive a lower net income from poultry in 1948 than in 1947. Feed costs, at least through the first half of 1948, will be substantially higher than this year, and other costs may average somewhat higher.

AppendixHISTORICAL DATA, POULTRY PRODUCTS
1910-47

The accompanying tables contain data pertinent to consideration in the outlook for the Poultry Industry. Most of the monthly series are carried regularly on page 2 of the Poultry and Egg Situation. The annual series have been published infrequently.

In developing data on domestic consumption (tables 25, 26 and 27) modifications were necessary for the World War II period as compared with previously employed procedures. Estimates are given for the net quantities taken from market channels by military forces. Furthermore, data on stocks and foreign trade do not always agree with other published figures. In the case of stocks, allowances have often been made for holdings by the USDA and other government agencies. Foreign trade data for 1941-46 are based largely on Department of Agriculture data rather than exclusively on Department of Commerce information as in pre-war years. Although some of the differences between USDA and Commerce figures are fairly sizeable, the resulting discrepancies in per capita egg consumption are not significant.

Per capita civilian consumption of poultry products in 1947 are tentatively indicated, 380 eggs, 23.7 pounds of chicken, and 4.1 pounds of turkey.

1/ Does not include young chickens lost.

2/ Loss during the year of chickens on hand January 1.

3/ Chickens sold plus consumed in households of farm producers and the plus or minus change in inventory.

4/ Weighted average of monthly prices per pound received by farmers times average weight of chickens sold.

Data compiled from Farm Production, Disposition, and Income Report.
